

From Director's Pen ...

Values in Environmental Education

Environment Values cannot be taught but inculcated by appreciating our environmental assets and experiencing the problems arising from destruction of an environment. Values in environment education is linked to quality of human life and transcend economic growth. These values will bring a better humanity, love & respect for nature. Our relationship to nature should be that of child to the mother. Those who live in perfect harmony with nature are really civilised persons. So, we have to redefine our civilization. Value education in relation to environment is learnt through an understanding and application of nature's oneness and the importance of its conservation. Each action by an individual must be linked to environmental consequences in a student's mind. s/o that a value is created which strengthens pro-environmental behaviour and prevents anti environmental actions. Ultimately, the individual pro-environmental action will move to that of a community. National Green Corps is a student's movement which is needed to spread the message of environmental management and sustainable development through eco-clubs in our state.
